# THE INNOVATIVE PLATFORM FOR MODAL INTEGRATION

EasyRailFreight was created to actively contribute to the challenge of decarbonization through the digitalization of logistics processes. The platform aims to promote and develop intermodal logistics services through an information system that facilitates the matching of supply and demand, the acquisition of complementary services and a comprehensive tour of the services available on the market.

# A SHARED, STRUCTURED AND PLANNED PROJECT

The project was developed between RFI Italian railway infrastructure manager and all the stakeholders involved through communication, listening and shared objectives. It was essential to define coherent and integrated objectives common to the entire logistics sector, which allowed a common, structured and planned path for the implementation of the different phases of the project.

# DIFFERENT MODULES

The Service Showcase and Service/Facilities Registers modules are designed to promote the intermodal services available on the market and have been defined in collaboration with key market players.

The New Transport Configurator module will allow users to create a door to-door report from RFI's catalog of remaining train paths.

The AT.L.A.S. (Logistics Atlas of Assets and Services) module will allow the user to benefit from a complete delocalised view of the structural characteristics of facilities and their services.

The Eco/Ferrobonus Reporting Form will make it possible to apply for and report on the subsidies granted to promote intermodality.

The analysis and reporting module will be dedicated to the analysis and dissemination of performance and the production of targeted reports on flows and volumes of goods for sectoral analysis.

# SUSTAINABILITY, COMPETITIVENESS, RELIABILITY AND FLEXIBILITY

EasyRailFreight enables better communication about intermodal logistics services, facilitates integrating different modes, reduces complexity, and improves the quality of intermodal logistics processes from a service perspective.

## THE MAIN INNOVATIVE FEATURES

EasyRailFreight is a search engine dedicated to logistics services involving the predominant use of rail transport. It measures the degree of decarbonization of transport in terms of lower CO<sub>2</sub> emissions compared to road-only solutions. It is also a single platform for the geo-location of logistics facilities and services. The main benefits of the platform are: simplified access to existing service offers, improved quality of information flows, better utilisation of infrastructure and terminal facilities, potential growth of intermodal transport, with system benefits in terms of decarbonisation and sustainability.
